

# htmlpagefooter

(mPDF >= 2.0)

htmlpagefooter – Define an HTML page footer with a given name

## Description

```
<htmlpagefooter name > html </htmlpagefooter>
```

Define an HTML page footer with a given name. Named footer can be referenced and set later in the document e.g. <sethtmlpagefooter>

**Note:** Do not name any header or footer starting with html\_ This prefix is reserved to identify an HTML header/footer when passing its name in a reference.

**Note:** Remember that, unlike most mPDF custom tags which are self-closing with />, htmlpageheader and htmlpagefooter require end tags. If you wish to make the HTML code compatible with browsers, see Custom tags

## Attributes

*name*

This attribute is a text string to use as the name for this footer.  
If name is **BLANK** or omitted, it is set as '\_default'.

## Content

*html*

Any valid HTML code can be enclosed between the tags, and will be parsed by mPDF as for any other content.

## Changelog

Version	Description
2.0	The tag was added.

## Examples
