

useSubstitutionsMB - Archived

Note: DEPRACATED mPDF >= 5.0. Prior to mPDF 5.0 *useSubstitutions* controlled the behaviour of character substitution when using Adobe core fonts, and *useSubstitutionsMB* was used for character substitution in multibyte/utf-8 documents. For mPDF >= 5.0 character substitution for documents using core fonts is always enabled, and the variable *useSubstitutions* has been changed to control character substitution in multibyte/utf-8 documents. For backward compatibility from version 5, *useSubstitutionsMB* will act as an alias for *useSubstitutions*

(mPDF >= 4.2)

useSubstitutionsMB – Specify whether to substitute missing characters in UTF-8 (multibyte) documents

Description

void **useSubstitutions**

Specify whether to substitute missing characters in UTF-8(multibyte) documents. Characters which cannot be displayed in the current set font, will be substituted by the same character in the Adobe core fonts (Symbol, Zapfdingbats etc.), or the default font of the document.

Note: useSubstitutionsMB causes errors inside <textarea> and <select> so from v4.4 it is disabled for text that appears inside those elements.

Values

useSubstitutionsMB = TRUE | FALSE

Values

TRUE : enable substitution
FALSE: disable substitution
DEFAULT: FALSE

Changelog

Version	Description
4.2	Variable was added.

Examples

Example #1

```
<?php
include("../mpdf.php");
$mpdf=new mPDF('UTF-8');
$mpdf->useSubstitutionsMB = true;
$mpdf->WriteHTML("Hallo World");
$mpdf->Output();
?>
```

Note: This may add significantly to the processing time for large files.
