

# img\_dpi

(mPDF >= 1.0)

img\_dpi – Specify size conversion for images using pixels

## Description

```
void img_dpi
```

Specify how to convert image sizes specified in "px" units (pixels). As a print medium, PDF documents do not have any inherent size for pixels. Width and height values of images set in pixels need to be converted to a real length. The dots-per-inch (dpi) affects the conversion from pixels for images; other objects using pixels as a length, are set by a separate variable *dpi*

**Note:** It is recommended that the values for *dpi* and *img\_dpi* are the same.

**Note:** This variable can be changed in the configuration file `config.php`

## Values

*img\_dpi*

### Values

**INTEGER** : set conversion for pixel - dots per inch  
**DEFAULT**: 96

## Changelog

Version	Description
1.0	Variable was added.
