InsertIndex()

(mPDF >= 6.0)

InsertIndex — Generate an Index for the document

Description

> void **InsertIndex** ([int *$usedivletters* [, boolean *$uselinking* [, string *$indexCollationLocale* [, string *$indexCollationGroup*]]]])

Inserts an Index for the document based on index entries made using <indexentry> or IndexEntry().

Parameters

usedivletters

> Defines whether to divide index entries starting with the same letter, using a (large) letter as a heading.
> **DEFAULT**: 1

> **Values**
> 1: show dividing letters in the Index
> 0: do not show dividing letters in the Index
> **BLANK** or omitted uses a default value of 1

uselinking

> Specify whether to add hyperlinks (internal links) to the entries in the document Index.
> **TRUE** or 1: add links to Index
> **BLANK** or omitted, 0 or **FALSE**: do not add links to the Index
> **DEFAULT**: **FALSE**

indexCollationLocale

> Set a Locale to determine the overall sort order of index entries e.g. 'en_GB.utf8'. Available options are determined by the locales available in your system configuration. Always use a utf-8 locale.
> **BLANK** or omitted uses current locale set in your system.

indexCollationGroup

> If you have set your index to use Dividing letters, this value will determine how letters are grouped under a dividing letter. Values should be selected from the files in folder `/collations/` e.g. 'English_United_Kingdom'
> NB This will not affect the overall order of entries, which is determined by the value above.
> **BLANK** or omitted - grouping occurs under the first letter of the index entries.

Changelog

Version	Description
6.0	Function was added
